CSE 110 - Lab 10

This lab is for practicing the object-oriented programming, and you need to implement a Student Class and implement a simple system to modify and view user information.
Use the following Coding Guidelines:
• When declaring a variable, you usually want to initialize it.

• Use white space to make your program more readable.

• Use comments after the ending brace of classes, methods, and blocks to identify to which block it belongs.

Assignments Documentation:
At the beginning of each programming assignment you must have a comment block with the following information:
```
/*-------------------------------------------------------------------------
// AUTHOR:      (Put your name here)
// FILENAME:   Lab10.java
// SPECIFICATION:  This program is for practicing the object-oriented programming.
// You need to develop the setName() method of Student Class and construct a simple system
// that can manage a student's name and age
// LAB LETTER:  (Put your Lab Letter here)
//-----------------------------------------------------------------------*/
```
Getting Started
Create a class called **Lab10**. Use the same setup for setting up your class and main method as you did for the previous assignments. Be sure to name your file **Lab10.java**.

The instructions of the assignment are as follows:

```
// import all and anything you need
//-->

public class Lab9
{

//Declare the main method
//-->
{
    Scanner in = new Scanner(System.in);

    // Create four 4 x 4 matrices (2D Integer Array) mat_A, mat_B, mat_C and mat_D
    //Hint: Read the values row wise
    //For example: If the input is 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16.
    //Then matrix will be:
    1  2  3  4
    5  6  7  8
    9  10 11    12
    13 14   15 16

    //Declare three 2D arrays with 4 rows and 4 columns an example is shown below
```

```
//int [] [] mat_A = new int [4] [4];

// Similarly create mat_B, mat_C and mat_D
// -->
// -->
// -->

// Read vales into matrix A and B
// Print "Enter values into mat_A:"
// -->

// Display the mat_A
// Print "Matrix A is "
for(int i = ? ; ?? ; ?){
    for(int j = ? ; ?? ; ?){

        // -->
    }
}

Print "Enter values into mat_B:"
// -->

// Display the mat_B
// Print "Matrix B is "
// -->
```

Task 1:
```
//Matrix Addition: Add the two matrices mat_A and mat_B and store the new matrix
in mat_C
    for (int i = ? ; ?? ; ?){
        for (int j = ? ; ?? ; ?){

            // -->
        }
    }

// Display the mat_C
// Print "Addition of two matrices: Matrix C is "
// -->
```

Task 2:
```
// Calculate the sum of elements of matrix C and display the value
// Declare an integer value <sum>
// -->
```

```
    for (int i = ? ;  ?? ;  ?){
        for (int j = ? ;  ?? ;  ?){

            // -->
        }
    }

    // Print "Sum of elements of matric C is <sum>"
    // -->
```

Task 3:
//Find transpose of matrix C and store the new matrix in mat_D
//Hint: The new matrix D will have rows which are columns of the original matric C
//The transpose of the matrix mentioned in the above example will be:
1 5 9   13
2 6 10 14
3 7 11   15
4 8   12 16

```
    for (int i = ? ;  ?? ;  ?){
        for (int j = ? ;  ?? ;  ?){
            mat_D [?] [?] = mat_C [?] [?];
            // -->
        }
    }

    // Display the mat_D
    // Print "Transpose of matrix C is: "
    // -->

    }
}
```

Sample Input:
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16

Sample Output:
```
Enter values into mat_A:

1       2       3       4

5       6       7       8

9       10      11      12

13      14      15      16
```

Enter values into mat_B:

1	2	3	4
5	6	7	8
9	10	11	12
13	14	15	16

Addition of two matrices: Matrix C is

2	4	6	8
10	12	14	16
18	20	22	24
26	28	30	32

Sum of elements of matrix C is 272

Transpose of matrix C is

2	10	18	26
4	12	20	28
6	14	22	30
8	16	24	32
